The three things you look for, *already on one sheet.*

You asked in clinic whether AI could pull up the last visit, the last prescription and the next appointment when a patient writes in. It can, and for you it is free.

This is a test clinic I built with Claude Fable 5.2. The sheet on the right is what you described. Every patient in it is made up.

1

It exists.

OpenAI demoed it on November 16. A patient writes in, an AI agent reads the chart, and a draft waits for the doctor.
Watch the clip or read the post.

2

It is free.

ChatGPT for Clinicians costs physicians nothing. You bring your NPI and license, and I do the setup.

3

I build the rest.

Refill checks, prior auth packets, letters in your voice. What the ready made tools cannot do, I build with Claude Fable 5.2.

TWO CATCHES

It runs when you ask, not on its own. And before it touches a real chart, you sign OpenAI's BAA. Until then, made up patients only.

Pick a day.
